

Assignment 1

Question 1: Write the SQL command to create a table called **Courses** with the following specifications:

- **course_id:** Integer → **Primary Key, Auto Increment.**
- **course_name:** Text (Max 100 characters) → **Not Null.**
- **credit_hours:** Integer → **must be between 1 and 5.**
- **course_status:** Text (Max 10 characters) → **Default value is 'Open'.**
- **start_date:** Date.

Question 2: Use the correct SQL command to add a new column:

- Column name: **instructor_email** (VARCHAR 100).
- Constraint: must be **UNIQUE**.

Question 3: Modify the table:

- Change the size of **course_name** from 100 to 60 characters.

Question 4: Insert a new course:

- **Name:** 'Database Systems'.
- **Credit Hours:** 3.
- **Start Date:** '2024-10-01'.
- (Let other fields auto-fill if possible).

Question 5: Insert multiple records using one command:

- **Course A:** 'Operating Systems', **instructor_email:** 'os@uni.edu'.
 - **Course B:** 'Networks', **instructor_email:** 'net@uni.edu'.
-

Notes:

1. Solutions should be submitted either as a **clear screenshot** of the code or as a **text file** containing the required SQL commands for each question in order.
2. **Do not submit identical work.** If I find matching code between any two students, both parties—the student who submitted the code and the student from whom it was copied—will **automatically receive a zero grade (0)** for the entire assignment.
3. The purpose of this assignment is to push you to practice and write the code **by yourself**. Feel free to discuss ideas and concepts with your colleagues, but the final, submitted code must be **your own, original work**.
